The Impact of Bank Shocks on Firm-level Outcomes and Bank Risk-taking

Hans Degryse, KU Leuven

(gemeinsam mit Olivier De Jonghe, Universität Tilburg; Sanja Jakovljević, KU Leuven; Klaas Mulier, Universität Gent und Glenn Schepens, Europäische Zentralbank)

We examine the impact of bank-loan supply shocks on firm outcomes and bank risk-taking employing bank-firm matched credit information for the period 2002-2012. Towards this end, we develop and estimate cross-sectional measures of bank-loan supply shocks. We find that firms borrowing from banks with negative supply shocks exhibit slower growth and investment, and a delayed negative response of employment. Banks faced with positive supply shocks show risk-taking behaviour at the extensive margin. Our estimated bank-loan shocks correlate positively with interbank liabilities growth and an alternative indicator of bank-loan supply, i.e. bank-lending standards.
